## Quasi-Elastic Neutrino Reactions on Carbon and Lead Nuclei

Saturday, 17 February 2018 20:15 (15 minutes)

We examine neutral-current quasi-elastic neutrino-nucleus reactions on  $^{12}$ C and  $^{208}$ Pb targets. We use the relativistic mean field theory approach to describe the nuclear dynamics. We compute the cross sections for the scattering of 150-MeV, 500-MeV and 1000-MeV neutrinos on a  $^{12}$ C target and study the effect of the strange-quark content of the nucleon which appears in these reactions via the isoscalar weak current. We compare our results with the data of the MiniBooNE experiment for mineral oil (CH<sub>2</sub>). We also calculate the cross section for the quasi-elastic neutron knockout reaction of 20 to 60-MeV neutrinos on a  $^{208}$ Pb target which is relevant to plans to use Lead as a target material in future supernova neutrino detectors.
