# Ab initio exploration of ${ }^{12} \mathrm{Be}$ 

Anna E. McCoy<br>TRIUMF, Vancouver

Feb. 28, 2023

Characteristics of ${ }^{12} \mathrm{Be}$

- Breakdown of the $N=8$ shell closure Intruder ground state
- $2 \alpha$ dumbell orbited by neutrons
- Shape isomer

## Outline

No-core shell model predictions for ${ }^{12} \mathrm{Be}$

- Rotational bands
- Level crossings and two-state mixing
- Shape observables
- E2 and E0 transitions
- Detangling the mixing problem
- Revisit shape observables
(a) $\sigma$-orbit

(b) $\pi$-orbit

## ${ }^{12} \mathrm{Be}$ Spectrum

| 7.2 | (2 ${ }^{+}$) |
| :---: | :---: |
| 6.275 5724- $\left.4^{+}{ }^{+}{ }^{+} 3^{-}\right)-$ |  |
| 4.580-4.412-(20) $2^{-}\left(2^{+}, 3^{-}\right)$ |  |

| $2.109{ }^{\text {e }}$ | $2^{+} ; 2$ |
| ${ }^{12} \mathrm{Be}$ |  |

Level scheme: https://nucldata.tunl.duke.edu/

## ${ }^{12}$ Be Rotational bands

Characterized by rotation of intrinsic state $\left|\phi_{K}\right\rangle$ by Euler angles $\vartheta \quad(J=K, K+1, \ldots)$

$$
\left|\psi_{J K M}\right\rangle \propto \int d \vartheta\left[\mathscr{D}_{M K}^{J}(\vartheta)\left|\phi_{K} ; \vartheta\right\rangle+(-)^{J+K} \mathscr{D}_{M-K}^{J}(\vartheta)\left|\phi_{\bar{K}} ; \vartheta\right\rangle\right]
$$

Rotational energy:

$$
E(J)=E_{0}+A[J(J+1)]
$$

Rotational $E 2$ transitions

$$
\begin{aligned}
& B\left(E 2 ; J_{i} \rightarrow J_{f}\right) \\
& \quad=\frac{5}{16 \pi}\left(J_{i} K ; 20 \mid J_{f} K\right)^{2}\left(e Q_{0}\right)^{2}
\end{aligned}
$$

## ${ }^{12}$ Be Band Evolution

- Revisit shape observables
(a) $\sigma$-orbit

(b) $\pi$-orbit

## ${ }^{12}$ Be shape observables

## ${ }^{12} \mathrm{Be}$ shape observables

 Alliance

## ${ }^{12}$ Be shape observables

## ${ }^{12}$ Be shape observables

- $r_{p}$ and $\beta_{p}$ of $0_{2 \hbar \omega}^{+}$slightly larger than for $0_{0 \hbar \omega}^{+}$ $0_{2 \hbar \omega}^{+}$observables less converged
- $r_{n}$ and $\beta_{n}$ of $0_{2 \hbar \omega}^{+}$slightly larger than for $0_{0 \hbar \omega}^{+}$ $0_{2 \hbar \omega}^{+}$observables less converged (maybe)
$-r_{p}<r_{n}$
$-\beta_{p}>\beta_{n}$
To what extent are calculated observables impacted by transient mixing?
(a) $\sigma$-orbit
$+\stackrel{\alpha}{\bigcirc}-\stackrel{\alpha}{\bigcirc}+$
(b) $\pi$-orbit

## ${ }^{12}$ Be transitions

Do not expect inter-band transitions between bands with very different shape.

[^0]

## ${ }^{12}$ Be transitions

## ${ }^{12}$ Be transitions

## Two state mixing

$$
H_{\text {mix }}=\underbrace{\left(\begin{array}{cc}
E_{1} & v \\
v & E_{2}
\end{array}\right)}_{\text {mixing Hamiltonian }} \rightarrow \underbrace{\binom{E_{1}^{\prime}}{E_{2}^{\prime}}}_{\text {"mixed" }}=\underbrace{\left(\begin{array}{cc}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right)}_{\text {mixing matrix }} \underbrace{\binom{E_{1}}{E_{2}}}_{\text {"unmixed" }}
$$

- Mixing angle $\theta$ depends on mixing matrix element $v$ and $\Delta E=E_{1}-E_{2}$
- Get "unmixed" energy from $E(J)=E_{0}+A[J(J+1)]$

## Mixing matrix element

$$
H=\left(\begin{array}{cc}
E_{1} & v \\
v & E_{2}
\end{array}\right)
$$

## Mixing angle

$$
\binom{E_{1}^{\prime}}{E_{2}^{\prime}}=\left(\begin{array}{cc}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right)\binom{E_{1}}{E_{2}}
$$

## Mixing angle

$$
\binom{E_{1}^{\prime}}{E_{2}^{\prime}}=\left(\begin{array}{cc}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right)\binom{E_{1}}{E_{2}}
$$

Mixed vs. unmixed

## Mixed vs. unmixed

## Mixed vs. unmixed

## Mixed vs. unmixed

## Unmixed ${ }^{12} \mathrm{Be}$ shape observables

## Unmixed ${ }^{12}$ Be shape observables

## Unmixed ${ }^{12}$ Be shape observables

## Shape summary

- Predictions for radii $r$ and deformation $\beta$ indicate for both $0^{+}$states:
- Neutron radius is larger than proton radius and still growing
- Protons are more deformed than neutrons Approaching convergence
- Radii of $0_{1}^{+}$larger than radii $0_{2}^{+}$(and is less converged)
$-0_{1}^{+}$has larger radii and is more deformed than $0_{2}^{+}$
- Consistent with $2 \alpha$ dumbbell surrounded by neutron cloud

## Probing underlying symmetries

- Ab initio calculations provides access to underlying wave functions of the collective states
- Using the "Lanczos trick" we can decompose the wave functions according to different symmetries
C. W. Johnson. Phys. Rev. C 91 (2015) 034313.
- Elliott's $\operatorname{SU}(3)$ : In limit of large quantum numbers, labels $(\lambda, \mu)$ are associated with deformation parameters
O. Castanos, J. P. Draayer, Y. Leschber, Z. Phys. A 329 (1988) 3

$$
\begin{aligned}
& \beta^{2} \propto r^{-4}\left(\lambda^{2}+\lambda \mu+\mu^{2}+3 \lambda+3 \mu+3\right) \\
& \gamma=\tan ^{-1}[\sqrt{3}(\mu+1) /(2 \lambda+\mu+3)]
\end{aligned}
$$

## $\mathrm{SU}(3)$ generators

## $Q_{2 M} \quad$ Algebraic quadrupole <br> $L_{1 M} \quad$ Orbital angular momentum

## Elliott U(3)

SU(3) symmetry of a configuration

- $\mathrm{SU}(3)$ coupling particles within major shells Each particle has $S U(3)$ symmetry $(N, 0), N=2 n+\ell$.
- $\mathrm{SU}(3)$ coupling successive shells
- $\mathrm{SU}(3)$ coupling protons and neutrons
- Different configurations lead to different $N_{\text {ex }}(\lambda, \mu) S$
- Lowest energies correspond to most deformed intrinsic state $\langle Q \cdot Q\rangle / r^{4} \propto \beta^{2}$

$$
\begin{aligned}
H & \propto-Q \cdot Q+E\left(N_{\mathrm{ex}}\right) \\
& =-6 C_{\mathrm{SU}(3)}(\lambda, \mu)+3 \mathbf{L}^{2}+E\left(N_{\mathrm{ex}}\right)
\end{aligned}
$$

Elliott rotational bands: ${ }^{12} \mathrm{Be}$

$$
H \propto-Q \cdot Q=-6 C_{\mathrm{SU}(3)}+3 \mathbf{L}^{2}+E\left(N_{\mathrm{ex}}\right)
$$

| $N_{\mathrm{ex}}(\lambda, \mu)$ | $S$ | $\Rightarrow$ | $\left\langle C_{\mathrm{SU}(3)}\right\rangle$ |
| :--- | :---: | :---: | :---: |
| $0(0,1)$ | 1 | $\Rightarrow$ | 4 |
| $0(2,0)$ | 0 | $\Rightarrow$ | 10 |
| $\cdots$ |  |  |  |
| $2(4,3)$ | 0,1 | $\Rightarrow$ | 58 |
| $2(7,0)$ | 1 | $\Rightarrow$ | 70 |
| $2(6,2)$ | 0 | $\Rightarrow$ | 76 |

## Decomposition by Elliott U(3)

## Decomposition by Elliott U(3)

## Decomposition by Elliott U(3)

Unmixed states have very different $\mathrm{SU}(3)$ fingerprint (different "shapes")

## Summary

- Ab initio NCSM with Daejeon16 predicts an intruder ground state
- $0^{+}$and $2^{+}$states mix as energies cross. Making analysis of convergence hard!
- State mixing appears to be well modeled by two-state mixing problem.
- States do not fully un-mix (non-zero interband $E 0$ and $E 2$ transitions).
- Predictions for radii $r$ and deformation $\beta$ indicate for $0^{+}$states:
- Neutron radius is larger than proton radius
- Protons are more deformed than neutrons
- $0_{1}^{+}$has larger radius and is more deformed than $0_{2}^{+}$
- $0_{1}^{+}$and $0_{2}^{+}$states have very different $\mathrm{SU}(3)$ (different "shapes")
- Next steps:
- Known exp. energies + mixing matrix element $v$, fixes "physical" mixing angle
- Use physical mixing angle to re-mix observables (or rather ratios of observables)
