

## **Observation of several sources of CP violation in $B^+ \rightarrow \pi^+ \pi^+ \pi^-$ decays**

*Tuesday, 7 May 2019 16:45 (15 minutes)*

Very large CP asymmetries in decays of B mesons to final states containing three charged particles have been observed and attracted much interest. We present new results from a Dalitz plot analysis of  $B \rightarrow 3\pi$  using a data sample corresponding to an integrated luminosity of  $3 \text{ fb}^{-1}$  of pp collisions recorded by the LHCb detector. Significant CP violation from different sources (S-wave, D-wave, S-P wave interference etc.) are established and may shed new light on understanding the underlying dynamics for CP violation in hadronic B decays.
